

AI RELATIONSHIP INTELLIGENCE FOR SCREENSHOT-ERA CONVERSATIONS

Turn chat screenshots into clearer understanding, better replies, and stronger relationship judgment

ReplyRight exists because many important relationship moments now happen inside fragmented messages, not formal conversations.

A late reply, a cold sentence, or a quiet pause can leave people asking: what does this mean, what should I say, and is this relationship changing?

WHY WE BUILT IT

Most people do not lack the ability to express themselves. They lack a steady way to read context when emotions are close and information is incomplete. ReplyRight gives users a calmer place to understand the conversation before they send the next message.

WHY IT MATTERS

People already screenshot conversations and ask friends what they mean. ReplyRight turns that behavior into a focused product: a private AI coach that helps users understand the other person, understand themselves, and respond with more steadiness.

The goal is not to speak for users. The goal is to help them see the relationship more clearly and choose a better next response.

What ReplyRight Gives Users

Conversation reading

Sage reads screenshots, separates speakers, detects emotional shifts, and flags uncertainty when roles are ambiguous.

Sendable responses

Users get natural replies that match the relationship stage, their intention, and the tone they want to carry.

Relationship signals

Sage surfaces communication patterns, conflict reactions, intimacy needs, risk signals, and next-step guidance.

Long-term portrait

Repeated conversations become a living relationship map instead of isolated chatbot answers.

Technical Route

ReplyRight combines multimodal AI, relationship memory, quality evaluation, and privacy controls into a product system that can improve with real usage.

01

Private text and screenshot input

02

Multimodal reading with speaker-confidence checks

03

Relationship reasoning and reusable memory

04

Output quality tests from real user cases

05

User deletion controls and sensitive-data minimization
